

This file contains a directory called project1. In that folder there are 3 html files, an image named cse.png and a java file named SimpleServer.java. Once in the project1 directory, Use the following commands to compile and run the program.

Compile: `javac SimpleServer.java`

Run: `java SimpleServer`

In order to get back the index.html page, use the following URL

Correct URL: <http://127.0.0.1:2323/project1>

URL to get 303 page: <http://127.0.0.1:2323/projectOne>

URL to get 404 response: [http://127.0.0.1:2323/\(anyothertext\)](http://127.0.0.1:2323/(anyothertext))

I did not use Wire Shark for the screenshots. I simply used existing methods to print the data to console. I was unable to finish my program and was not able to print the body of the responses, i was only able to print the headers.
